技术规格

Background:	This gene encodes one of the major intermediate filament proteins of mature astrocytes. It is used as a marker to distinguish astrocytes from other glial cells during development. Mutations in this gene cause Alexander disease, a rare disorder of astrocytes in the central nervous system. Alternative splicing results in multiple transcript variants encoding distinct isoforms.
Applications:	WB
Name of antibody:	GFAP(Phospho-Ser38)
Immunogen:	Peptide sequence around phosphorylation site of Serine 38 (R-L-S(p)-L-A) derived from Human GFAP.
Full name:	glial fibrillary acidic protein
Synonyms :	0
SwissProt:	P14136
WB Predicted band size:	50 kDa
WB Positive control:	HeLa cells lysates

WB Recommended dilution: 500-1000
