技术规格

Background:	This gene encodes a subunit of the transcription factor complex nuclear factor-kappa-B (NFkB). The NFkB complex is expressed in numerous cell types and functions as a central activator of genes involved in inflammation and immune function. The protein encoded by this gene can function as both a transcriptional activator or repressor depending on its dimerization partner. The p100 full-length protein is co-translationally processed into a p52 active form.
Applications:	WB
Name of antibody:	NFkB2(Phospho-Ser872)
Immunogen:	Peptide sequence around phosphorylation site of serine872(S-Q-S(p)-V-E) derived from Human NF-κB p100 .
